Defense Rulebook

Your play. Their likely response.

A two-minute opponent-preparation demo

Try one play

Choose any of 32 opponents. Enter formation, personnel, motion, concept, down, distance, and field zone. Load a sample, or import one structured JSON play. Your play stays on the device.

Read the evidence

Inspect rush-count, blitzer, and box estimates with exact and pooled support, game counts, observed-frequency intervals, and base rates. Download the opponent PDF. Grey means no demonstrated edge or limited support.

Know the limit

Rams five-plus-rush Brier: 0.1985 model versus 0.1950 base rate, 63 held-out dropbacks in two games. Box: 0.2371 versus 0.2465, 127 plays. Lower is better. This small development check proves no general edge.

Bring authorized data

The proposed team product runs on the club's licensed feeds in its approved environment. Vendor permission for processing, models, retention, and output is required. PFF, SIS, and NGS connectors are proposed, not connected.

Next step

Review one opponent workflow and a pilot data checklist with a football research lead. Measure preparation time, coach corrections, and future-game performance. No pricing or pilot commitment is made here.
