Your play. Their likely response.

Weekly opponent preparation

A two-minute opponent-preparation demo for coordinators and football research staffs.

32 opponents
One evidence standard

Every probability carries counts, game support, and a base-rate check.

October 22, 2026 FTN/nflverse snapshot. Preparation only. No league or club endorsement.

Source notes accompany this draft. Data-derived material: CC BY-SA 4.0.

Start with a play from your own book

Pick the opponent. Enter formation, personnel, motion, and concept. Add down, distance, and field zone.

01

Choose

02

enter

03

inspect

Load the sample, or upload one structured JSON play. Files stay on the device. Diagrams and PDFs use manual entry.

Working demo: getkres.github.io/ted-board/nfl/. No enterprise connector is connected.

Source notes accompany this draft. Data-derived material: CC BY-SA 4.0.

See the evidence beside the response

Read the estimated rush count, charted blitzer, and box response. Compare exact-look support with the broader cell used for pooling.

Counts before confidence

Observed cell frequency, 95% Wilson interval, game count, team background, and original held-out Brier stay visible.

Intervals describe observed frequencies, assume independent plays, and omit clustering and model uncertainty.

Source notes accompany this draft. Data-derived material: CC BY-SA 4.0.

Grey when the model loses to base rate

The Rams five-plus-rush model is grey. It does not improve the original held-out Brier score.

0.1985 vs 0.1950

Model versus team base rate. Lower is better. 63 dropbacks across two held-out games. No proven rush-count edge.

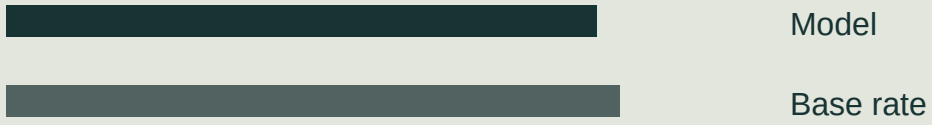
Fixed policy: weeks 1-4 train, weeks 5-6 check. Existing development holdout, not fresh validation.

Source notes accompany this draft. Data-derived material: CC BY-SA 4.0.

One encouraging result stays experimental

The Rams seven-plus-box estimate improves Brier on the same small check. It still needs future-game replication.

0.2371 vs 0.2465



Model versus base rate. 127 held-out scrimmage plays, two games. Improvement is an observation, not calibrated certainty.

No new holdout was created. Concept success, optimal plays, and quarterback pressure are not measured.

Source notes accompany this draft. Data-derived material: CC BY-SA 4.0.

Take the rulebook back to film

Download the selected opponent's PDF. Review seven situation observations, their early-game and later-game counts, and the missing labels.

14/18 → 0/8

Rams third-and-long five-plus rush: discovery versus check. Drift matters more than a confident full-sample percentage.

October 22 FTN/nflverse snapshot. Current coverage, safety shell, and named rushers are unavailable.

Source notes accompany this draft. Data-derived material: CC BY-SA 4.0.

Your licensed data. Our software layer.

Proposed team deployment: approved club export or connector, processing inside the club's approved environment, and staff-facing rulebooks.

A public demo with explicit limits

The demo uses FTN/nflverse public data, with source and derived material shared under CC BY-SA 4.0. No restricted competition tracking is distributed.

Observed today
Licensed labels next

Personnel and split-formation effects, coverage, named rushers, and concept success need current authorized labels. They are not fabricated.

nflverse licensing and FTN loader. Public access does not mean unrestricted use. BDB 2027 access is accepted.

Source notes accompany this draft. Data-derived material: CC BY-SA 4.0.

Measure a pilot against the staff's workflow

Proposed scope: one opponent, the staff's existing terminology, authorized data, and a chronological untouched game block.

01 Approved input

02 Review evidence

03 Staff decision

Measure preparation time, coach corrections, useful rules, support, and Brier versus the same-team baseline. Predefine pass and stop criteria with the club.

Pilot proposal only. No customer, contract, measured time savings, price, or commercial feed is claimed.

Source notes accompany this draft. Data-derived material: CC BY-SA 4.0.

Try one play in two minutes

Open the demo, load the Rams sample, change motion, inspect the grey forecast, and download the PDF.

Then review a pilot data checklist

A short technical session can establish source permission, field mapping, evaluation scope, and the staff member who owns the result.
